

EQUINOX CMMS

Every breakdown, tracked to a verified fix.

A maintenance management platform with a built-in AI assistant and voice agent, so a fault reported by click, chat or phone call becomes an assigned, tracked work order.

THE PROBLEM

Maintenance still runs on phone calls, chats and spreadsheets

Reports get lost

Faults are reported by phone, WhatsApp or word of mouth. Nothing guarantees that anyone acts on them.

Wrong person sent

Dispatch depends on who the supervisor remembers, not on who is on shift, nearby and free.

No history to learn from

When a machine fails again, nobody can see what was done last time, by whom, or how long it took.

The result: longer downtime, missed follow-ups, and no data to improve from.

THE IDEA

One place where every fault is reported, assigned, worked and closed, whether it comes in by click, by chat or by phone call.

Report

Assign

Track

Close

Learn

Everything maintenance needs, in one app

Work orders

Assign, track and close jobs with tasks, time, parts and signatures.

Planned work

Preventive maintenance that runs on a schedule, before machines fail.

Assets

Every machine with its location, files, downtime and full history.

Requests

Anyone can report a fault, even without an account, through a public link.

Inventory

Spare-part stock, low-stock tracking and purchase orders.

Meters

Readings that open a work order on their own when a limit is crossed.

Locations

Sites and areas on a map, with their assets and teams.

People

Teams, roles, permissions, shifts and workload per technician.

Analytics

Repair times, failure intervals, costs and backlog at a glance.

Integrations

REST API, API keys, webhooks and live updates.

From fault to fix in six steps

 **Steps 01 and 03 (outlined) can run hands-free:** the voice agent takes the report and assigns a technician during the call.

THREE WAYS IN

Report a fault in whatever way is easiest

Web app

Forms for staff, plus a public request link that needs no login. Ideal at a desk or on a phone browser.

AI assistant

Ask in plain language. It finds the machine, checks its history and drafts the work order for you.

Voice agent

Call a number and describe the problem in your own language. The agent files the job and assigns it.

Ask a question, get a work order to confirm

- 1 Knows what you're looking at**
Say "this pump" and it uses the asset or work order you have open.
- 2 Answers from live data**
Looks up assets, service history and open jobs. It never makes up records.
- 3 It drafts, you decide**
New jobs and status changes appear as a preview. Nothing is saved until you click Confirm.

EXAMPLE CHAT

When was this pump last serviced? It's leaking again.

Its last completed job was a seal replacement. I've drafted a new work order for you to review.

DRAFT WORK ORDER

Pump leaking again, check seals

Priority: High · Asset: the pump you have open

Confirm

Cancel

Call it in. The agent does the paperwork.

THE OPERATOR SAYS

“Press number 3 on line B is leaking oil and making a grinding noise.”

Any language: the caller's exact words are saved on the work order.

Works over a real phone line or in the browser.

Detects the caller's language
and replies in it

Identifies the equipment
by name, code, model or location, and checks its status

Creates the work order
with a severity from Low to Critical

Assigns the best technician
ranked automatically, then notified in the app

Escalates when it's urgent
raises priority, alerts admins and phones the technician

Every assignment comes with its reasons

HOW THE SCORE IS BUILT

Based at the machine's site	+40
Light workload minus 10 per open job	up to +30
On shift today more free hours, more points	+20 to +30
No shift set	+10
Off shift today	never picked

EXAMPLE: PUMP FAULT AT SITE A

Ravi K. · assigned 100

same site · on shift, 8h free · 0 open jobs

Meena S. · backup 60

same site · no shift set · 2 open jobs

Arjun P. · backup 47

other site · on shift, 6h free · 1 open job

The top three and their reasons are saved with the assignment, so anyone can see why.

Every call leaves a complete, live trail

Each step the agent takes is saved as an event and pushed instantly to the operations team.

Supervisors can watch a call unfold live, then review the full transcript and every action afterwards.

Transcript

Questions asked

Tool calls

Timings

Failures

- 10:02:04 ● Inbound call started
- 10:02:11 ● Caller language: Tamil (ta)
- 10:02:26 ● Equipment identified: Press 3 at Line B
- 10:02:31 ● Severity: High
- 10:02:32 ● Work order WO-142 created: oil leak
- 10:02:34 ● Ravi K. assigned to WO-142
- 10:02:34 ● In-app notification sent to Ravi K.

Guardrails built into every AI action

Changes need consent

The chat assistant previews every change. Nothing is saved until a person confirms it.

Same permissions

AI actions run under a real account, so every role and access rule still applies.

Grounded answers

Answers come from database lookups. If nothing is found, the assistant says so.

Fixed set of actions

The voice agent can only use six server actions, and each one validates its input.

Signed callbacks

Messages from the voice service are checked against a secret signature before use.

No duplicate jobs

If the AI retries a step, it gets the same work order back instead of a second one.

ARCHITECTURE

A modern stack that runs anywhere

Enterprise-ready from day one

Secure sign-in

Token-based login, plus single sign-on and LDAP for company directories.

Role-based access

Separate view, create, edit and delete rights for every module.

Company isolation

Each organisation only ever sees its own assets, people and records.

API keys

Connect ERP, BI or sensor systems without sharing anyone's password.

Change history

Work order edits are versioned, ready for audits and trend analysis.

Your own servers

Self-hosted with Docker, so data and files stay on your infrastructure.

Where Equinox goes next

NOW • LIVE

Report and dispatch

- Full maintenance platform
- AI chat assistant
- Voice agent in any language
- Ranked, explained assignment
- Live call activity trail

NEXT

Self-correcting dispatch

- Skills and certifications in matching
- SLA timers with auto-escalation
- Instant reassignment on dropout
- Spare parts reserved on approval

LATER

Predict and prove

- Supervisor sign-off before closing
- Tamper-evident audit trail
- IoT sensors that open jobs
- Failure prediction models

From breakdown to **verified fix.**

Report it any way. Assign it right. Track it to the end.
